

Scenarios and challenges for feeding the world in 2050

bruno.dorin@cirad.fr

World Bank BBL, Washington D.C., 21 September 2010

The foresight exercise Agrimonde (introduction)

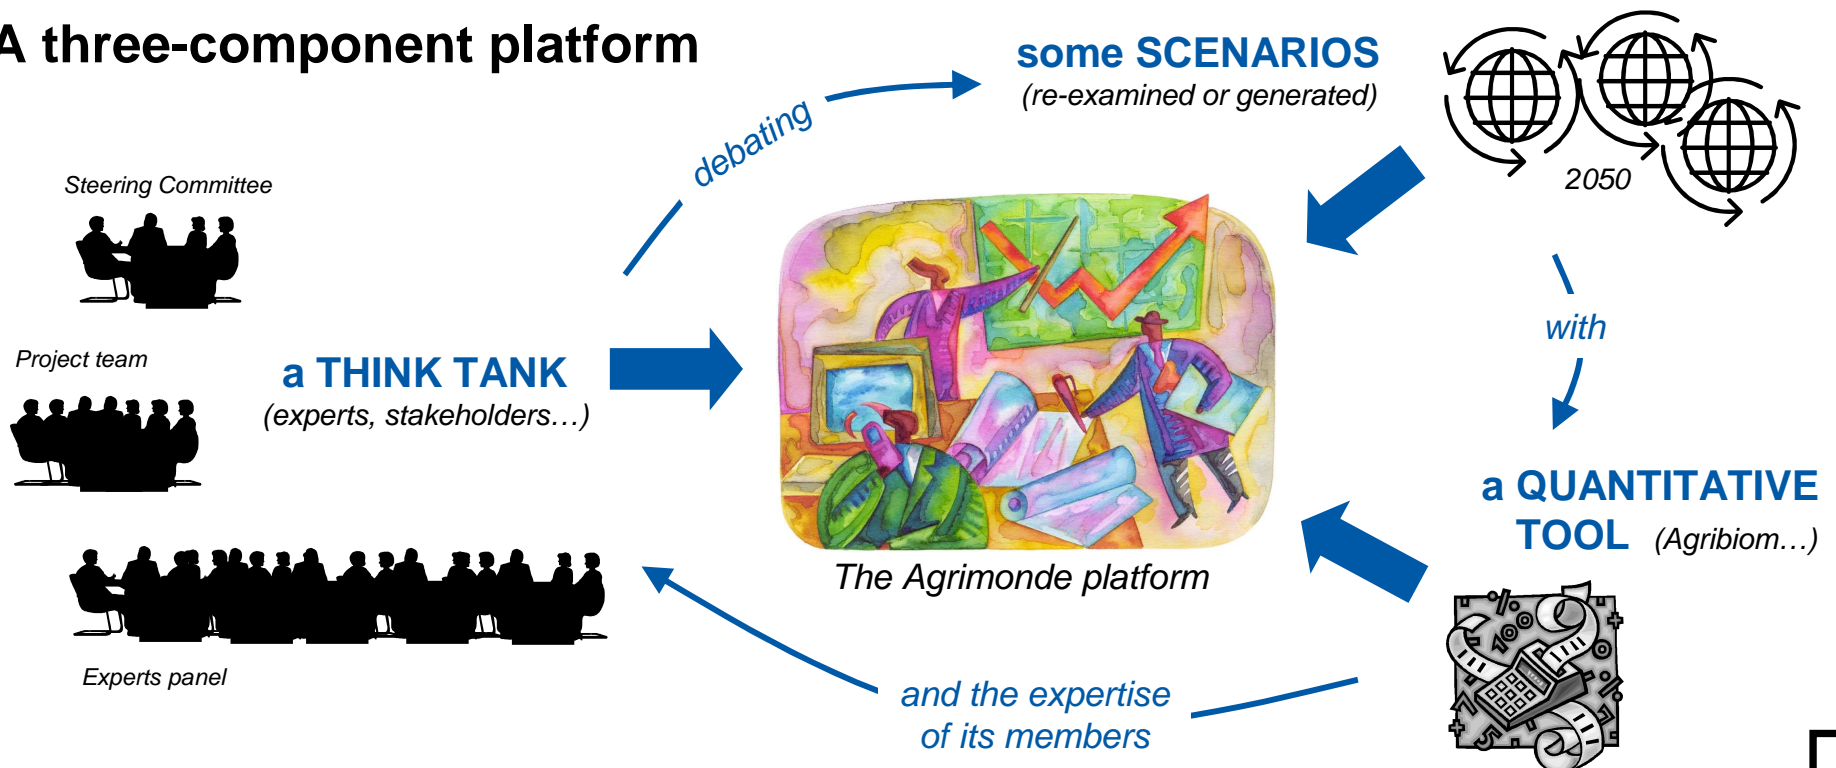

A joint INRA-CIRAD project (2006-2009 = 1st phase)

- French National Institute for Agricultural Research (www.inra.fr)
- French Agricultural Research Centre for International Development (www.cirad.fr)

Objectives

- (1) to explore possible futures of food and farming systems up to 2050
- (2) to design and debate orientations and strategies for INRA - CIRAD research agendas
- (3) to contribute to international debates on food, agriculture and the environment

A three-component platform

Aims & architecture of Agribiom

A quantitative tool designed for exploring
past and future world production, consumption & trade of biomasses
through (1) collective expertise & debates
(2) hybrid modeling works

① The ambition for Agrimonde

Having a quantitative tool for :

(1) revisiting the past,
better understand it (with new estimates,
new models...)

(2) debating the future
...from scenarios description (own or external qualitative conjectures)

translated / summarized into
few quantitative parameters (populations, diets, non-food uses
land uses, productivities...)

Global
Consistency ?

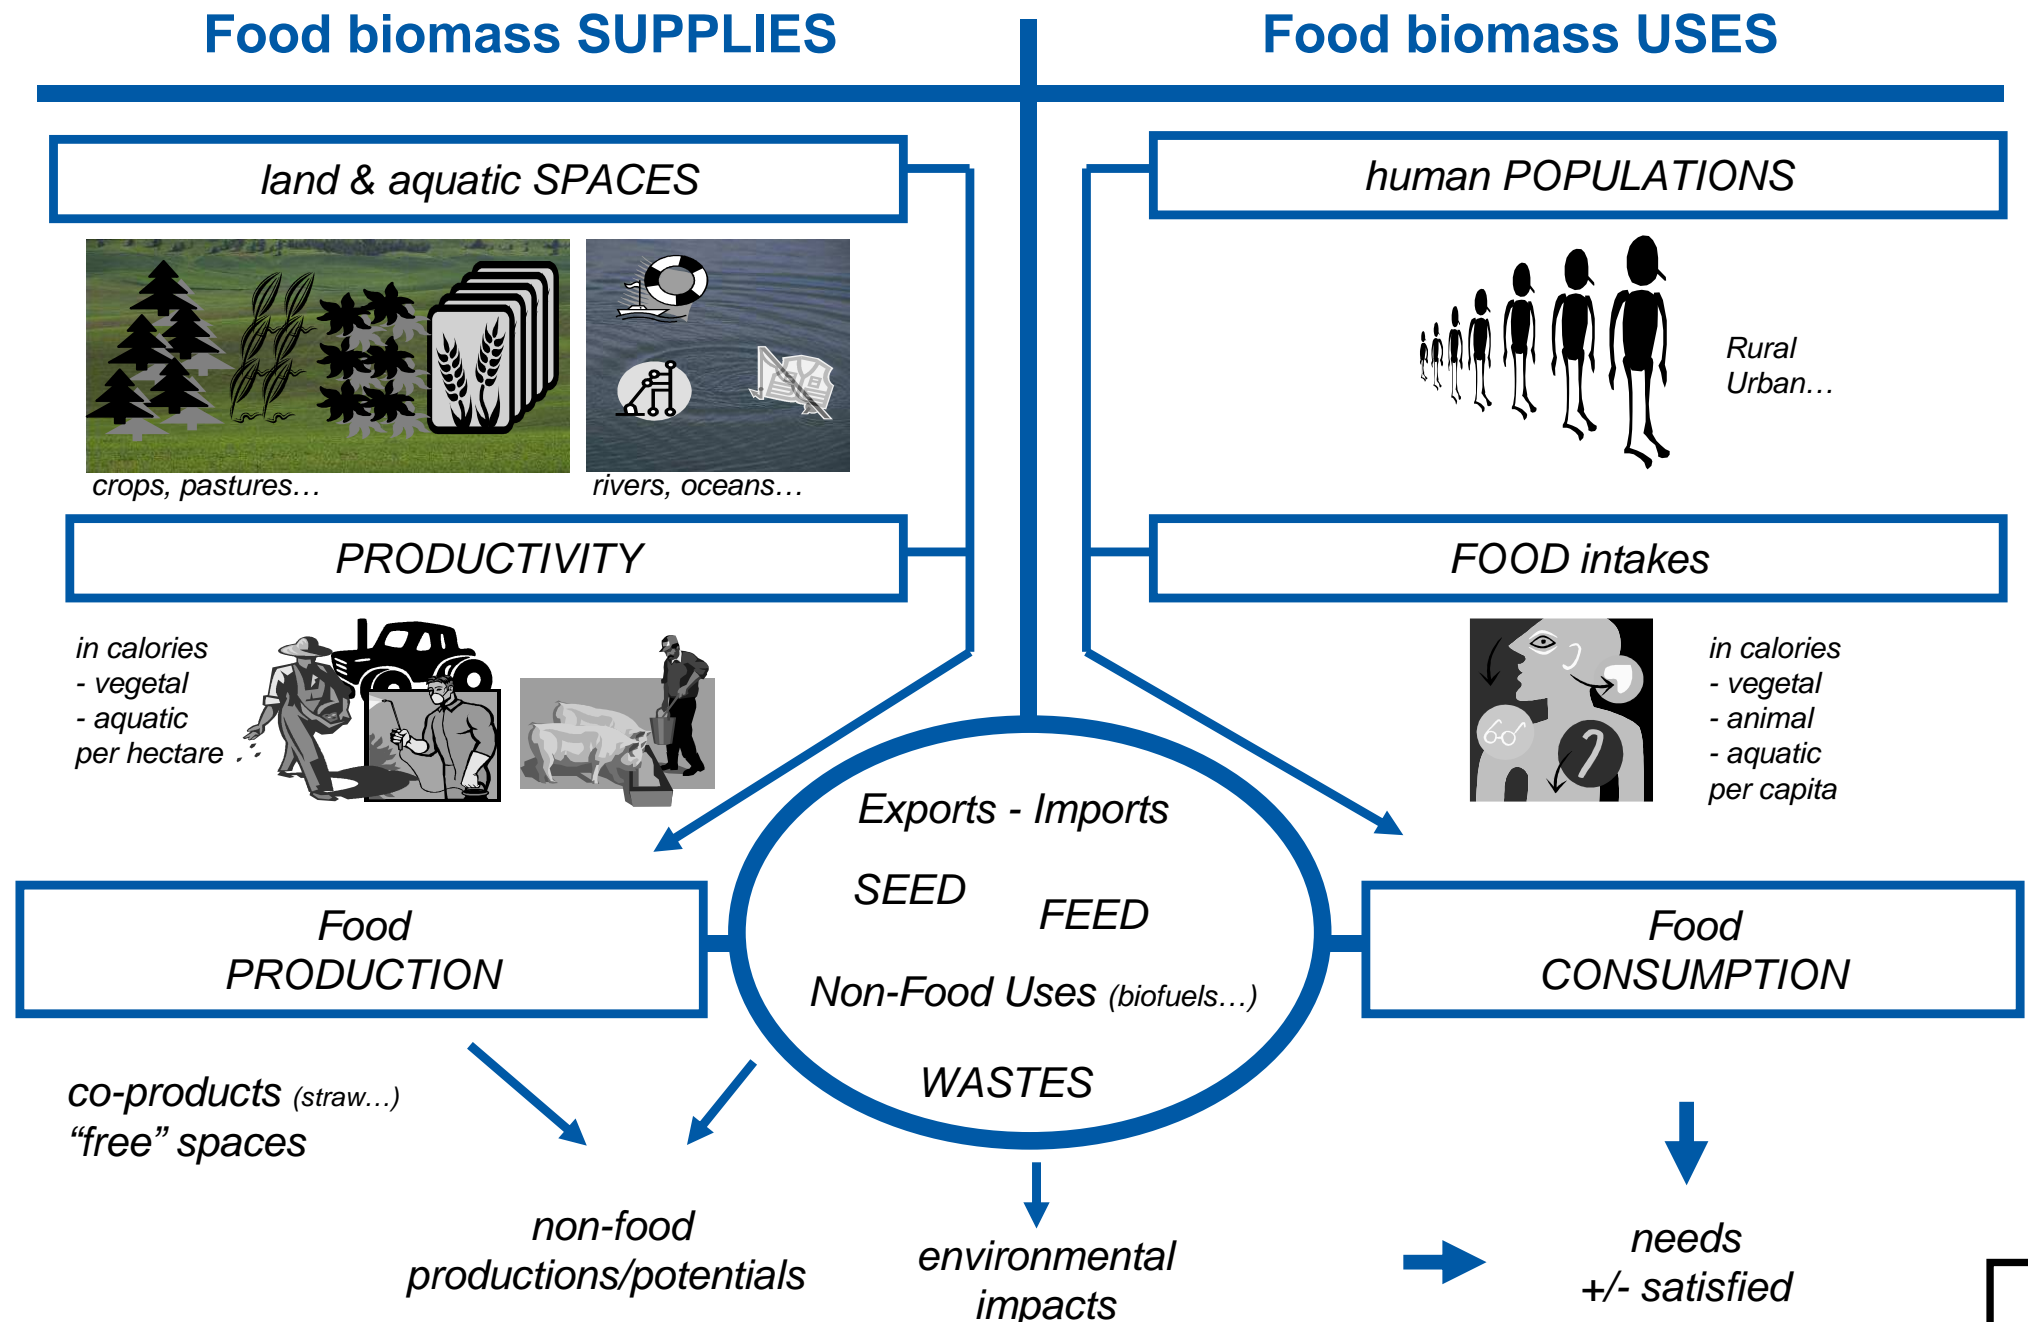

(physical equilibrium between
biomass uses & resources)

Implications ? (international trade,
energy & water consumptions...)

Impact of variants ?
(populations, composition of diets...)

② The basic engine

Regional S/U balances of food biomasses
reconstituted (1961-2003, using FAO commodity balances in tons)
and/or simulated (2030, 2050...)
for more than 97% of the world land surfaces (149 regions)

③ The unit of account

Food CALORIES

(or equivalent for oilcakes, molasses...)

Total Calories = Carbohydrates (4 kcal/g)
+ Proteins (4 kcal/g)
+ Fat (9 kcal/g)

④ The items

All primary foodstuffs 1961-2003: 120 product lines of FAO Commodity Balances (SUA)

gathered into 5 « compartments » of food biomasses

PLANTS (VEGE)

Cereals : wheat, rice, barley, maize...

Sugar crops : sugarcane, sugar beat...

Pulses : beans, peas...

Oilseeds : soybean, groundnut, coconut...

Roots & tubers : cassava, potato...

Fruits & vegetables : apple, onion...

Stimulants : cocoa, coffee, alcohol...

GRAZING ANIMALS (RUMI)

Meats : bovines, goat, mutton...

Milk, Butter, Animal fats...

Non-GRAZING ANIMALS (MONO)

Meats : poultry, pig...

Eggs...

FRESH WATER (AQUA)

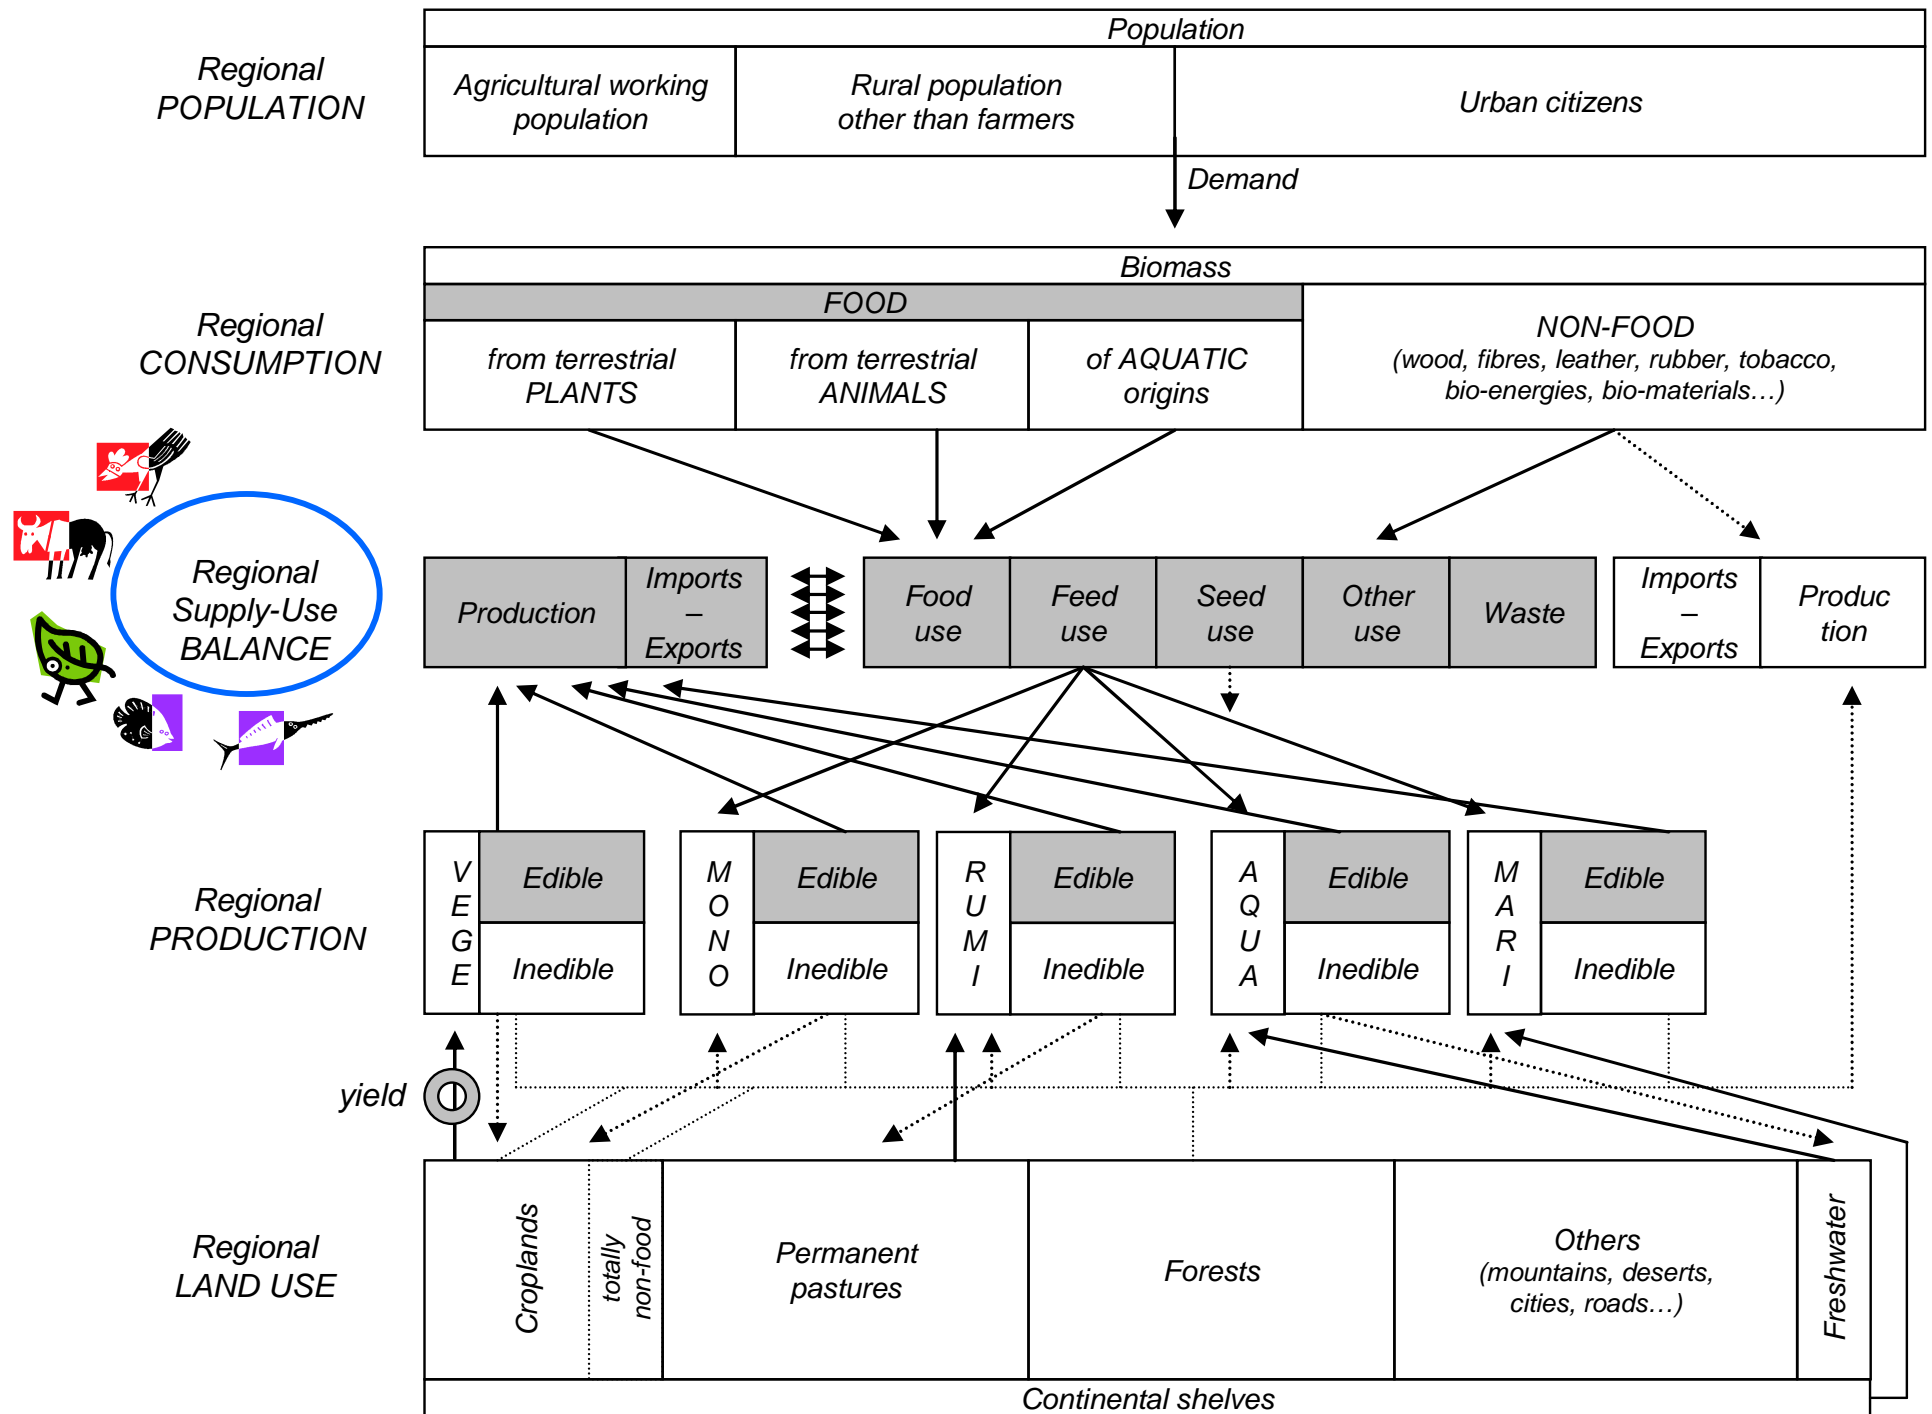

Fishes...

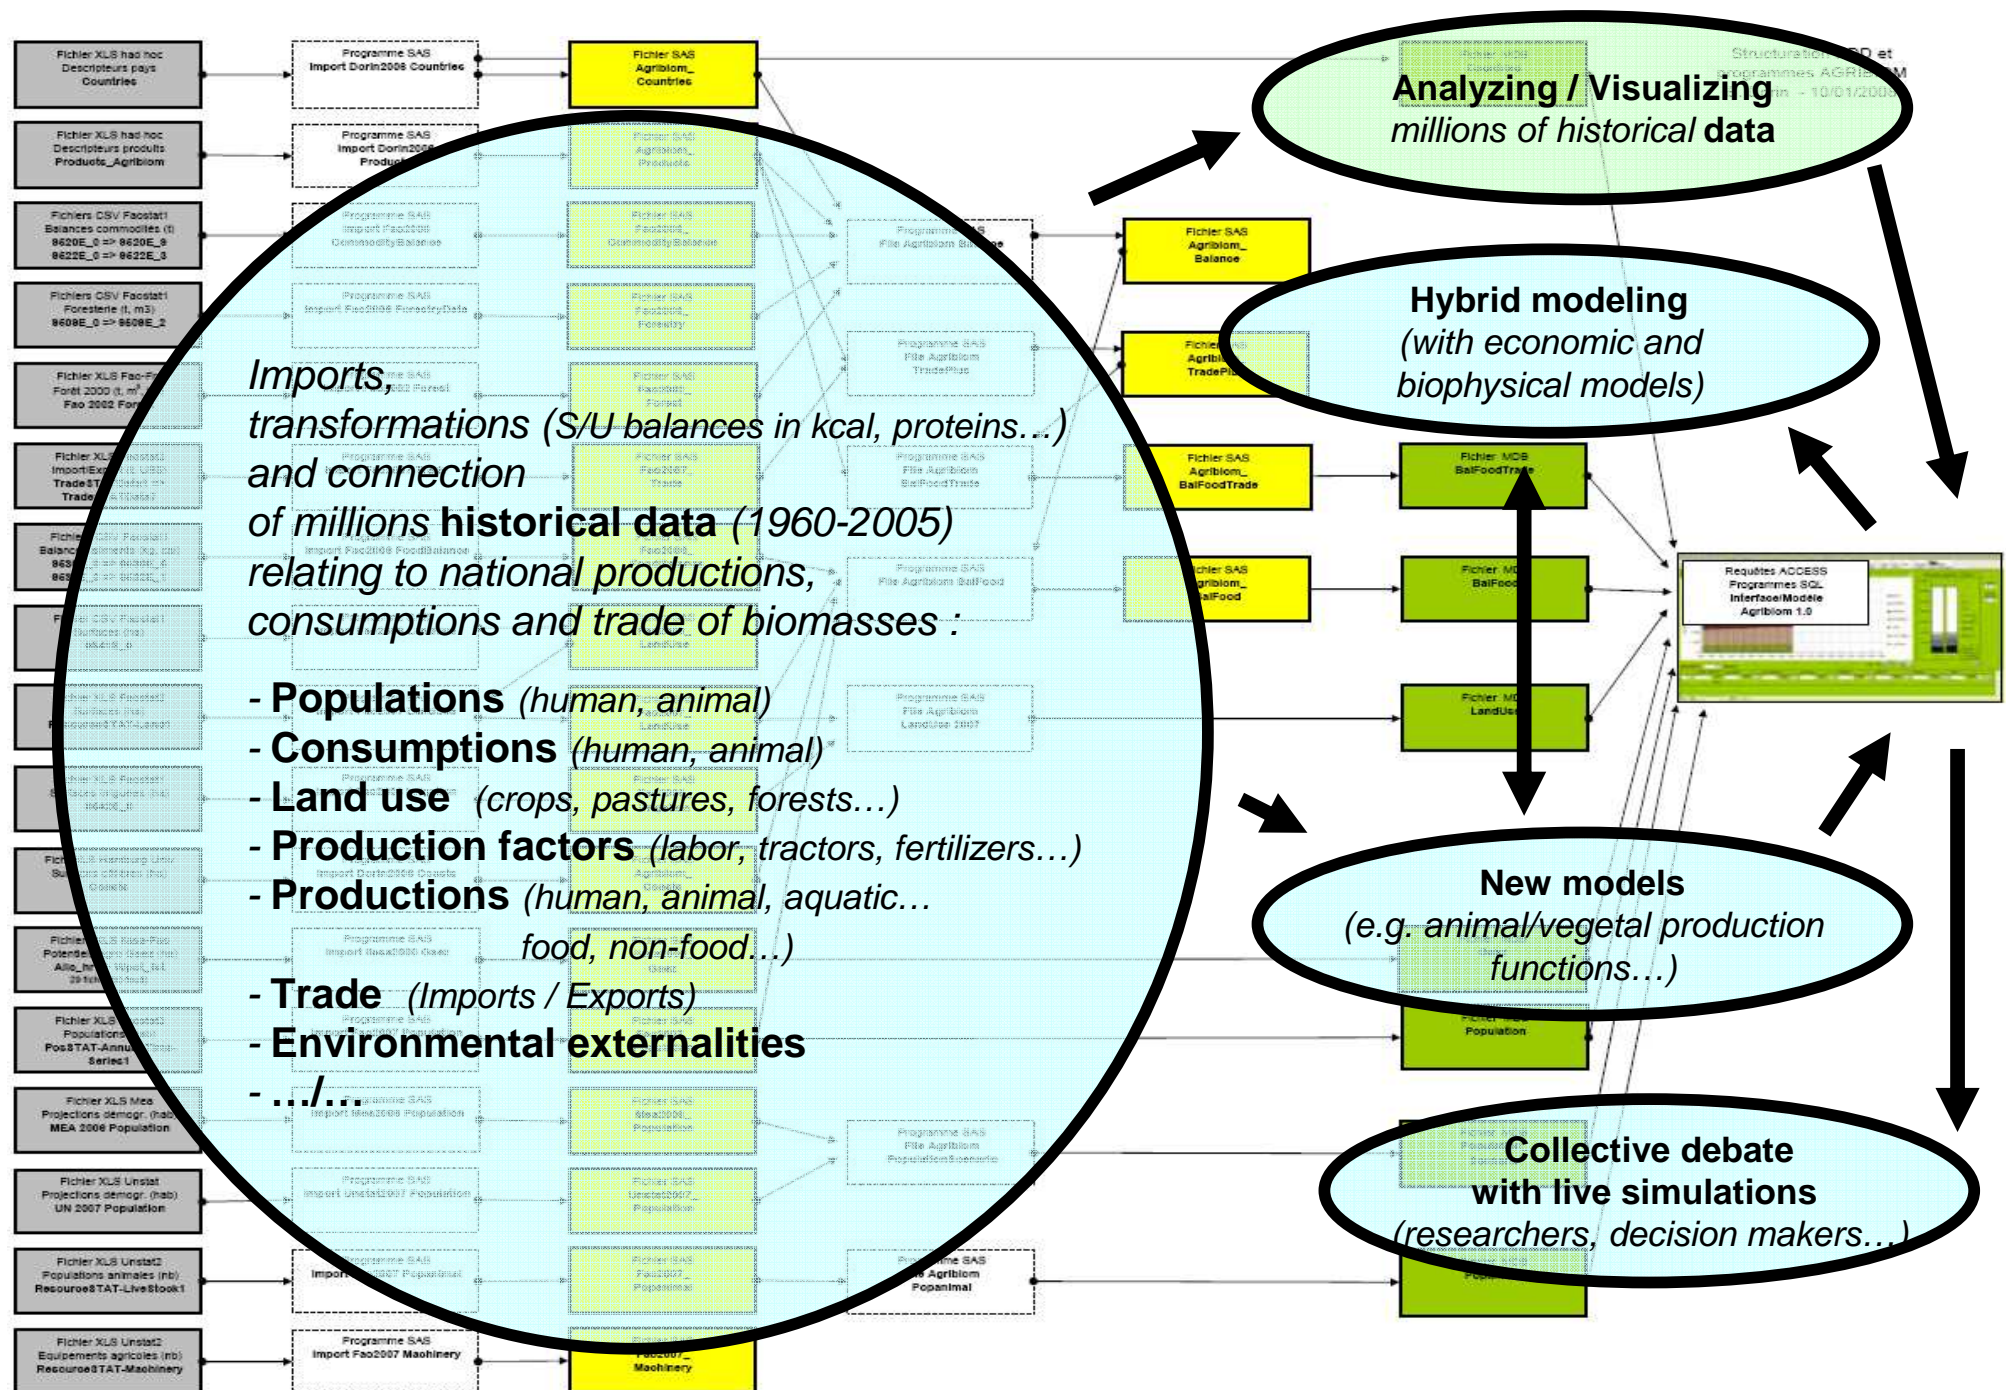

MARINE (MARI)

Demersal & Pelagic fishes... Fats...

Overview of the AGRIBIOM biomass balance model

⑤ An interactive interface

⑥ A statistical model for livestock production

(in 2003, the OECD cattle ate 3 times as much food as the SSA human population did)

RUMI production (meat & milk proteins)
 MONO production (meat & eggs proteins)

$$= f (FEED, PASTURE, MONO/RUMI))$$

Cross-country animal
 production functions

■ Results :

- replicate very-well the past 40-year of national/regional/global animal productions
- “on-line” tests and modeling (choice of model, change of parameters/coefficients, simulations...)

RUMI
production of proteins (Gg / year)

MONO
production of proteins (Gg / year)

OECD-90

FSU

ASIA-Ch
(Asia without China)

⑦ Annual R/U balances of food biomass reconstituted (1961-2003) ...or simulated

From past trends to scenarios

A 1961-2003 brief overview of the world food economy through Agribiom eyes...

① From average world increases...

■ *The population doubled*

■ *The per-capita food availability increased too...*

Source: own calculations using FAO data

On the resources side:

Agricultural area ↗

- Pastures : + 11% →
- Crops : + 13% →

Land and labour productivities ↗

- Veg calories / cultivated ha : + 123%
- Veg calories / farmer : + 53%

Livestock ↗

② ...to regional disparities

The 6 MEA regions

- OECD = Oecd-1990
- MENA = Middle East & North Africa
- FSU = Former USSR
- ASIA = Asia
- LAM = Latin America & the Caribbean
- SSA = Sub-Saharan Africa

■ Human populations

Farmers : highly and increasingly concentrated in Asia and Africa

Inhabitants (million)

Active agricultural workers (million)

Source: data from FAO

■ Highest land productivity in ASIA

Note : 10 000 kcal =
 ~ 2.4 kg of soybean
 ~ 2.8 kg of rice milled
 ~ 2.9 kg of pea
 ~ 3.0 kg of wheat
 ~ 15.0 kg of potato
 ~ 58.8 kg of tomato

— SSA
 — LAM
 — ASIA
 — FSU
 — MENA
 — OECD

Vegetal kcal / day / cultivated hectare

Source: own calculations using FAO data

■ A labour productivity boom in OECD

Vegetal kcal / day / agricultural worker

■ *A boom of food trade
to clear surpluses and fill in deficits*

*Net balance of vegetal food trade
(Exports – Imports)*

Source: own calculations using FAO data

But still very large disparities in per-capita food availabilities

OECD

- Animal proteins :
71 g / day on 125 (60%)
- Animal fats :
89 g / day on 165 (55%)

Sub-Saharan Africa

- Animal proteins :
12 on 60 g / day (20%)
- Animal fats :
10 on 48 g / jour (20%)

③ Towards which new «equilibrium» in 2050 ?

Resources, productions, trade and uses of food biomasses (2003)

Ressources, production, échanges et consommation alimentaire en 2003 par grandes régions du monde

Scenarios, hypotheses, collective debates... (2050)

Agribiom simulations

Scenarios and challenges for feeding the world in 2050

First explorations by Agrimonde : the “AGO” and “AG1” worlds...

① Towards which new «equilibrium» in 2050 with...

- +/- **population** growth (7-11 billions inhabitants in 2050) ?
- +/- incomes, **incomes distribution** and population migrations
(regional opportunities of decent incomes, self-subsistence...) ?
- +/- change in food **diets** (vegetal/animal, macro/micro nutrients...) ?
- +/- demand in **non-food products** (bio-energies, bio-materials...) ?
- +/- economic liberalization and **trust in international trade**
("sovereignty" in cereals / other basic vegetal foodstuffs / feed for animal productions / animal foodstuffs...) ?
- +/- **environmental regulations** (forests, greenhouse gases, biodiversity...) ?
- +/- important **crisis on present yield boosts** (fossil fuels, water, pesticides, phosphates...) ?
- +/- **climate change**
- .../...

② The “AGO” and “AG1” worlds

■ Two scenarios “reprocessed”

The Doubly Green Revolution scenario

Source: Griffon M., 2006. *Nourrir la planète. Pour une Révolution doublement verte*, Odile Jacob, Paris

The Green Revolution, which was introduced on a world scale after World War II, made it easy to ignore the threat of hunger. But the Green Revolution also encouraged overpopulation; it ravaged the environment in many places; it created inequalities in the sharing of the planet's wealth, and these inequalities have made the threats we must face in the coming decades even greater than those the world had to confront in the early twentieth century.

Agrimonde platform

The “Agrimonde 1” scenario (AG1)

The “Agrimonde GO” scenario (AGO)

The Millennium Ecosystem Assessment scenarios

Source: MEA, 2005. *Ecosystems and Human Well-being: Scenarios*, The Millennium Ecosystem Assessment, Washington DC.

Global Orchestration

A globally connected society that focuses on global trade and economic liberalization and takes a reactive approach to ecosystem problems but that also takes strong steps to reduce poverty and inequality and to invest in public goods such as infrastructure and education. Economic growth in this scenario is the highest of the four scenarios, while it is assumed to have the lowest population in 2050.

Globalization

Techno-Garden

A globally connected world relying strongly on environmentally sound technology, using highly managed, often engineered, ecosystems to deliver ecosystem services, and taking a proactive approach to the management of ecosystems in an effort to avoid problems. Economic growth is relatively high and accelerates, while population in 2050 is in the midrange of the scenarios.

Reactivity

Order from Strength

A regionalized and fragmented world, concerned with security and protection, emphasizing primarily regional markets, paying little attention to public goods, and taking a reactive approach to ecosystem problems. Economic growth rates are the lowest of the scenarios (particularly low in developing countries) and decrease with time, while population growth is the highest.

Proactivity

Adapting Mosaic

Regional watershed-scale ecosystems are the focus of political and economic activity. Local institutions are strengthened and local ecosystem management strategies are common; societies develop a strongly proactive approach to the management of ecosystems. Economic growth rates are somewhat low initially but increase with time, and population in 2050 is nearly as high as in Order from Strength.

Regionalization

Main quantitative assumptions

		2003	2050 - AG1	2050 - AGO
Uses	Population	6.2 Gcap	8.8 (+42%)	8.8 (+42%)
	Human food	3,000 kcal/day/cap 17% Non-Veg	3,000 17% Non-Veg	3,590 (+19%) 23% Non-Veg
	Other uses	~14,440 Gkcal/day	Feed (Agribiom) + seed (3%) + waste (max 4%) + other (max 5%)	Feed (Agribiom) + seed (3%) + waste (max 4%) + other (max 5%)
Resources	Food yields	~19,190 kcal/day/ha	~20,030 (+4%)	~32,940 (+75%)
	Crop land - for N-Food	~1,530 Mha neg.	~2,105 (+38%) 224 Mha	~1,860 (+21%) 217 Mha
	Pastures	~3,330 Mha	~2,845 (-14%)	~3,585 (+8%)
	Forest	~3,905 Mha	no change	no change

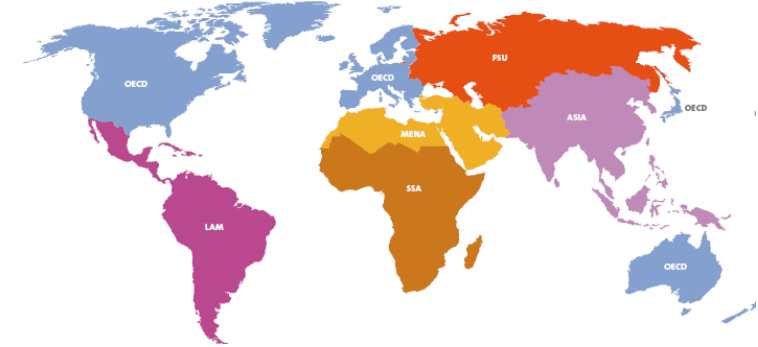

Trade : h01 : trade of plant food only (i.e. no trade of animal foodstuffs or by-products)
h02 : import of animal foodstuffs instead of import of plant feed

Food

③ Two new hypothetical equilibriums for 2050...

■ Base 2003

Scenario 2050 - AGO

AGO.h01

Scenario 2050 - AG1

AG1.h01

④ Possible narratives for each scenario

Scenario principles → quantitative assumptions → quantitative consistency
 → qualitative assumptions → complete scenario

	Agrimonde GO	Agrimonde 1
Growth, develop & migrations	Economic growth in LDC based on agricultural development	
	High level of global growth Acceleration of urbanization	Global growth based on deving countries Stabilization of urbanization
Regulations and governance	Massive north south transfers	
	Trade liberalization	UNOFS : price distortions, volatility, temporary exceptions, envt protection multi-functionality
AKST-D	Massive public and private investment	
	Continuing the same technological pathway	Scientific innovation for ecological intensification : ▪ specific / generic ▪ interactive, mutualization
Energy	Massive investments	
	Rapid growth of energy demand Energy efficiency Biofuels	Demand management Energy efficiency, renewable energies Decentralized production Farm autonomy

⑤ Main lessons from 2 scenarios (3 open questions)

The planet can feed properly 9 billion people in 2050

However...

- (1) *The contents of each person's plate (quantity + ingredients + presentation) will be a key driver for:*
- *solving important human health problems (from under-nutrition to obesity)*
 - *preserving some ecosystem services (climate/disease/flood regulations, pollination...)*
 - *saving some agricultural inputs (water, fossil fuels, fertilizers, pesticides...)*
 - *reducing post-harvest losses and food wastes*
 - *opening larger opportunities for non-food productions (bio-energies, biomaterials...)*
 - *promoting a diversity of production systems, landscapes and rural livelihoods*

➡ What does a “sustainable food system” mean (content / tradeoffs / pathway) ?

- (2) *Food trade can secure some regional food needs and avoid huge migrations, provided the net-deficit regions/populations can:*
- *pay for their food imports (local opportunities of incomes?)*
 - *rely on a fair, transparent & LT secured international trade regulation system*
...enhancing small farmers incomes & environment-friendly

➡ How to design such a international trade system ? a UNOFS ?

(3) Preserving or improving agricultural yields calls for breakthroughs:

- *Need for much less polluting & less dangerous techniques (for workers, flora, fauna...)
based on:*
 - *much better exploitation of ecosystem services (pollination, IP...)*
 - *new technologies (ITC, genetics, monitoring...)*
 - *scientific & local knowledge (social learning processes)*
 - *“Ecological intensification” might emerge as an interesting option
for sustainable biomass production and for food security of poor farming families,
provided institutional and technological lock-in situations can be overcome*
 - *Need to reframe the usual yield/area dilemma & the production/protection divide*
 - *city/countryside \Leftrightarrow urban & peri-urban agriculture...*
 - *forest/agriculture \Leftrightarrow agro-forestry, agro-ecology...*
 - *“high yield - land sparing” (man outside the nature)
 \Leftrightarrow “wildlife-friendly farming” (man into the nature) (Green & al, 2004)*
 - ...
- ➔ *Which renewed technological patterns ?*
- *how to think outside conventional boundaries ?*
 - *which organizational/institutional breakthroughs ?*

To follow up...

- *Need to debate food and agriculture scenarios at various regional levels (...with various stakeholders)*
- *Need to better simulate (with Agribiom and other quantitative tools)*
 - *induced consumptions of fossil fuel and water*
 - *GHG emissions/sinks (C, CO₂, CH₄, N₂O...)*
 - *regional employments / incomes / migrations*
 - *.../... and biodiversity ?*
- *Need to involve a large set of actors, stakeholders ...and academic disciplines into food production, food security, food safety and food quality issues!*
